Synthetic Homotopy Theory TD1: Inductive types

January 21, 2020

An inductive type is defined by a list of constructor, allowing you to build inabbitantss of the type, and an elimination principle allowing you to build map out of the type. In this first section we will study identity types of some examples of inductive types. In class we saw how to compute the identity types in product types using the *encode-decode method*. In summary:

- 1. We define a family $Eq_{A\times B}: A\times B\to A\times B\to \mathcal{U}$.
- 2. We define functions in:

encode:
$$(z, z' : \text{Eq}_{A \times B}(z, z')) \rightarrow z = z' \rightarrow \text{Eq}_{A \times B}(z, z')$$

and

decode:
$$(z, z' : \text{Eq}_{A \times B}(z, z')) \rightarrow \text{Eq}_{A \times B}(z, z') \rightarrow z = z'$$

- 3. We show that they are inverse to each other.
- 4. From this we conclude that:

$$(x, y) =_{A \times B} (x', y') \simeq (x =_A x') \times (y =_B y')$$

Now we try to apply this method to other types.

Exercise 1 The unit type

We define Eq₁: $1 \rightarrow 1 \rightarrow \mathcal{U}$ by:

$$\mathrm{Eq}_{\mathbf{1}}(x,y):\equiv\,\mathbf{1}$$

Question 1 Prove that for any $A: \mathcal{U}$ we have $(A \times 1) \simeq A$ and that $(A \to 1) \simeq 1$

Question 2 Define a function:

encode:
$$(x, y: 1) \rightarrow x = y \rightarrow \text{Eq}_1(x, y)$$

(Hint: start by path induction).

Question 3 Define a function:

decode:
$$(x, y: 1) \rightarrow \text{Eq}_1(x, y) \rightarrow x = y$$

(Hint: start by induction on *x* and *y*).

Question 4 Prove that **encode** and **decode** are inverse to each other. Conclude that:

$$(x = y) \simeq 1$$

for any x, y: 1.

Exercise 2 The empty type

Question 1 Prove that for all $A : \mathcal{U}$ we have $(A \times \mathbf{0}) \simeq A$ and $(\mathbf{0} \to A) \simeq \mathbf{1}$.

Question 2 Prove that for all x, y : **0**, we have x = y.

Question 3 Recall that $x \neq y$ is defined as $x = y \rightarrow 0$. Prove that for all x, y : 0, we have $x \neq y$.

Question 4 Prove that for all $x, y : \mathbf{0}$, anything holds for $x =_{\mathbf{0}} y$.

Question 5 Let *A* be a type. Show that any map $A \rightarrow \mathbf{0}$ is an equivalence.

Exercise 3 The type of booleans

We define Eq₂: $\mathbf{2} \rightarrow \mathbf{2} \rightarrow \mathcal{U}$ by:

$$Eq_2(0,0) := 1$$

$$Eq_2(0,1) := 0$$

$$Eq_2(1,0) := 0$$

$$Eq_2(1,1) := 1$$

You should convince yourself that these are reasonable expectation for equalities in a two-point set.

Question 1 Define a function:

encode:
$$(x, y : 2) \rightarrow x = y \rightarrow Eq_2(x, y)$$

(Hint: start by path induction).

Question 2 Define a fucntion:

decode:
$$(x, y : \mathbf{2}) \rightarrow \text{Eq}_{\mathbf{2}}(x, y) \rightarrow x = y$$

(Hint: start by induction on x and y).

1

Question 3 Prove that **encode** and **decode** are inverse to each other. Conclude that **Question 2** Conclude that $0 \neq 1$, and that for any $m, n : \mathbb{N}$ we have: $0 \neq 1$.

Question 4 (Optional) Can you find a shorter proof that $0 \neq 1$?

Exercise 4 Sum types

We define:

$$\operatorname{Eq}_{A+B}: A+B \to A+B \to \mathscr{U}$$

by:

$$\operatorname{Eq}_{A+B}(\operatorname{inc}_{l}(x), \operatorname{inc}_{l}(x')) :\equiv x =_{A} x'$$

$$\operatorname{Eq}_{A+B}(\operatorname{inc}_{l}(x), \operatorname{inc}_{r}(y')) :\equiv \mathbf{0}$$

$$\operatorname{Eq}_{A+B}(\operatorname{inc}_r(y),\operatorname{inc}_l(x')) :\equiv \mathbf{0}$$

$$\operatorname{Eq}_{A+B}(\operatorname{inc}_r(y), \operatorname{inc}_l(y')) :\equiv y =_B y'$$

You should convince yourself that these are reasonable expectation for equalities in a two point set.

Question 1 Assume given $A, B, C : \mathcal{U}$, prove that $(A + B \to C) \simeq (A \to C) \times (B \to C)$

Question 2 Prove that for any $A: \mathcal{U}$ we have $(A + \mathbf{0}) \simeq A$.

Question 3 Prove that $1 + 1 \approx 2$.

Question 4 Using the same method as in exercises 1 and 3, prove that for all z, z' : A + Bwe have:

$$(z=z') \simeq \operatorname{Eq}_{A+B}(z,z')$$

Exercise 5 The natural numbers

We define $Eq_{\mathbb{N}}: \mathbb{N} \to \mathbb{N} \to \mathcal{U}$ by:

$$Eq_{\mathbb{N}}(0,0) := 1$$

$$\mathrm{Eq}_{\mathbb{N}}(0,\mathbf{s}(n)) :\equiv \mathbf{0}$$

$$\mathrm{Eq}_{\mathbb{N}}(\mathbf{s}(m),0) :\equiv \mathbf{0}$$

$$\mathrm{Eq}_{\mathbb{N}}(\mathbf{s}(m),\mathbf{s}(n)) := \mathrm{Eq}_{\mathbb{N}}(m,n)$$

Note that we used Eq_N in the definition of Eq_N which is okay because N is recursive.

Question 1 Using the same method as in exercises 1, 3 and 4 prove that for all $m, n : \mathbb{N}$ we have:

$$(m=n) \simeq \operatorname{Eq}_{\mathbb{N}}(m,n)$$

$$(m=n) \simeq (\mathbf{s}(m) = \mathbf{s}(n))$$

Univalence contradicts unicity of identity proofs **Exercise 6**

Recall that the unicity of identity proofs (UIP for short) is the principle that for all p, q: x = A y we have p = q. We will use the type of booleans 2 to prove that univalence contradicts UIP.

Question 1 Define an equivalence **swap**: $2 \approx 2$ swapping 0 and 1.

Question 2 Show that **swap** \neq **id**₂ in **2** \simeq **2**.

Question 3 Conclude that we have two distincts elements in 2 = y/2 using univalence.

* Exercise 7 **Quasi-equivalences**

Recall that for $f: A \rightarrow B$ we defined isQuasiEquiv(f) as:

$$(g: B \to A) \times (f \circ g \sim \mathbf{id}_B) \times (g \circ f \sim \mathbf{id}_A)$$

Question 1 Assume we want to prove something for all types $A, B : \mathcal{U}$ and all equivalences $\epsilon: A \simeq B$. Using univalence and path induction prove that it is enough to prove what we want for the equivalences id_A for any $A: \mathcal{U}$.

Question 2 Using previous question, prove that for all equivalences ϵ : $A \simeq B$ we have:

isQuasiEquiv(
$$\epsilon$$
) \simeq ($a:A$) \rightarrow $a=a$

Types of lists, and more * Exercise 8

We assume that you are familiar with the inductive type **List**_A of lists of elements in A. We denote by \emptyset the empty list and a :: l the list with head a and tail l.

Question 1 Using the encode-decode method, prove that:

$$(a :: l =_{\mathbf{List}_A} a' :: l') \simeq (a =_A a) \times (l =_{\mathbf{List}_A} l')$$

Question 2 If you happen to know other inductive types (e.g. W-types), what can you prove about their identity types using the encode-decode method?
